

Advanced Percutaneous Tendon Repair

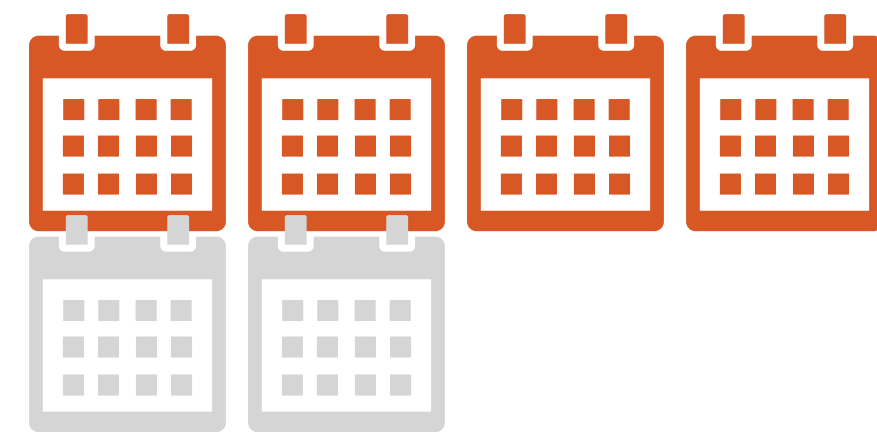

Invasive Achilles Tendon Repair

15~20%

Complication Rates

Including infection, re-rupture, paresis of sural nerve, deep vein thrombosis.^{*1}

3 month

Pain persists

6 -8 months of rehab.^{*2} Might not enjoy doing the sport they love forever.

"I've seen patients transferred to our hospital with serious postoperative infections nearly every week for over 20 years. That's what drove me to develop a method for real-time, ultrasound-guided minimally invasive Achilles tendon repair."

Dr. Wang President of Taiwan Orthopedic Foot & Ankle Society

Current Challenges in Open/ Percutaneous Achilles

High
Complications Rate^{*1}

Open Procedure

High complication rate, low paratenon preservation and painful/ limited early function outcome: 6+ months long recovery time,

Percutaneous

Uncertain suture placement, high sural nerve risk reduction, ultrasound compatibility.

1.Aktas S, Kocaoglu B. 2009.

Financial impact

Market Size & Existing reimbursement:

Ruptured Acute Achilles Tendon Rupture, Haglund's Deformity: 100,000 + cases / yr
(CPT code: 27650, 27652, 27680, 28118)

Challenge:

- 1.Hospitals incur significant costs when managing complications following primary Achilles tendon repair surgeries (CPT code: 27650).
- 2.Limited percutaneous system (device + anchor) current available in the market.

Opportunity:

All-in-one MIS solution including ultrasound-guided system, anchors, and sutures.

Pull-through Market Opportunity: \$4,500 per case

This positions the full-system kit for premium reimbursement while streamlining OR workflow and inventory management.

2. J Lantto et al. 2015

Faster Recovery

First in Human

Acute Achilles Tendon Rupture

Time: 28 mins (incision to incision)

1.5 cm Incision + 2 suture anchors

Patient outcome:

- Almost no pain,
- Good push up power
- Return to daily activity in 12 weeks out
